General information

Introduction

The F115 has been developed for applications where the direction of flow is an issue. Applications can be found by loading and unloading of ships where one bi-directional flowmeter is used. An other application is the correction of back-flow due to shocks in a pipeline caused by piston pumps or valve behavior. It is required to offer two pulse signals from the flowmeter which are 90° or 240° degrees out of phase. A wide selection of options further enhances this models capabilities.

Display

The display has large 17mm (0.67") and 8mm (0.31") digits which can be set to show flow rate and totals. On-screen engineering units are easily configured from a comprehensive menu. In case of a reverse flow, the flow rate will be displayed as a negative value. The totalizers will count down.

Configuration

All configuration settings are accessed via a simple operator menu which can be pass-code protected. Each setting is clearly indicated with an alpha-numerical description, which avoids confusing abbreviations and baffling codes. Once familiar with one F-series product, you will be able to program all models in the series without a manual. All settings and totals are safely stored in EEPROM memory in the event of sudden power failure.

Analog output signal

The positive and / or negative flow rate is re-transmitted with the (0)4 - 20mA or 0 - 10V DC output signal. The output signal is updated ten times per second. The output value is user defined in relation to the flow rate, e.g. 4mA equals to 0L / Hr and 20mA equals to + or -200L / Hr. The output signal can be passive, active or isolated where the passive output type will loop power the F115.

Pulse output

The scaleable pulse output, reflects the count on the accumulated display. Moreover, if the transmitted pulse reflects a count-down situation due to reverse flow, the second output will be switched. The pulse length is user defined from 0.008 second up to 2 seconds. The maximum output frequency is 64Hz. The output signal can be a passive NPN, active PNP or an isolated electro-mechanical relay.

Signal input

The F115 accepts most pulse input signals for volumetric flow or mass flow measurement. To detect the direction of flow, it is required to offer two signals 90° or 240° out of phase. The input signal types can be selected for both inputs in the configuration menu without having to adjust any sensitive mechanical dip-switches or jumpers. Different types of sensors are allowed for both inputs.

Communication

All process data and settings can be read and modified manually or through the Modbus communication link (RS232 / RS485). Full Modbus functionality remains available for the Intrinsically Safe version (TTL).

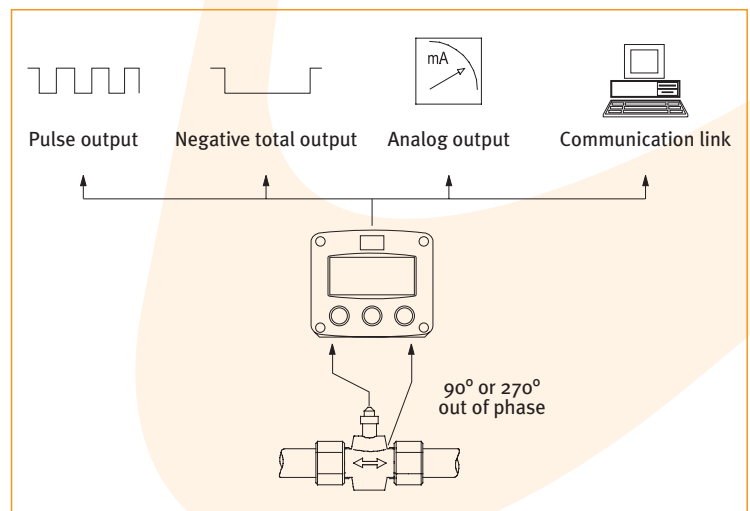

Hazardous areas

This model has been ATEX and IECEx certified Intrinsically Safe for gas and dust applications, with an allowed operational temperature of -40°C to +70°C (-40°F to +158°F). A flame proof enclosure with ATEX certification offers the rating $\text{Ex II 2 GD EEx d IIB T5}$.

Enclosures

Various types of enclosures can be selected, all ATEX and IECEx approved. As standard the F115 is supplied in an GRP panel mount enclosure, which can be converted to an GRP field mount enclosure. Most popular is our rugged aluminum field mount enclosure with IP67 / NEMA 4X rating. Both European or U.S. cable gland entry threads are available.
