General information

Introduction

The F133 is a unique product as it is especially designed for a controlled delivery of undefined quantities. It offers all the functionality known from gas stations to fill-up your car. The unit incorporates special functions with delay times to start a pump first, control a valve and expect a flow within a certain period of time.

Moreover, the flow rate and the allowed total dispensed quantity is monitored as well.

If, for whatever reason, no pulses are coming in, the delivery will be terminated after a pre-defined time. Sub-deliveries are also catered for allowing you to fill up several compartments within one and the same delivery. A wide selection of options further enhances the capabilities of this model, which includes Intrinsic Safety and full Modbus communication.

Display

The display has large 17mm (0.67") and 8mm (0.31") digits which will zero after a start-command and display "leading eight's". During the delivery, the actual dispensed quantity is displayed together with the actual flow rate and the status of the controller. Several resettable and non-resettable totalizers are available as well as a batch counter. All values are backed-up in EEPROM memory every minute.

Configuration

All configuration settings are accessed via a simple operator menu which can be pass-code protected. Each setting is clearly indicated with an alphanumeric description, which avoids confusing abbreviations and baffling codes. Once familiar with one F-series product, you will be able to program all models in the series without a manual. All settings are safely stored in EEPROM memory in the event of sudden power failure.

Control outputs

One output is available to control a pump after receiving a start-signal. After the start-up-time, a second output will be switched to control the valve to allow the product to be dispensed. The output signals can be passive NPN, active PNP or an isolated electro-mechanical relay.

Signal input

The F133 will accept most pulse input signals for volumetric flow or mass flow measurement. The input signal type can be selected by the user in the configuration menu without having to adjust any sensitive mechanical dip-switches or jumpers. Further, two inputs are available to control the process remotely if desired.

Communication

All process data and settings can be read and modified manually or through the Modbus communication link (RS232 / RS485). If desired, the delivery can even be started and stopped through communication. After the delivery, the dispensed quantity and batch number is available to be used for ticket printing (B.O.L.). The F133 has the ability to be locked-out until this information has been read and initialized.

Hazardous areas

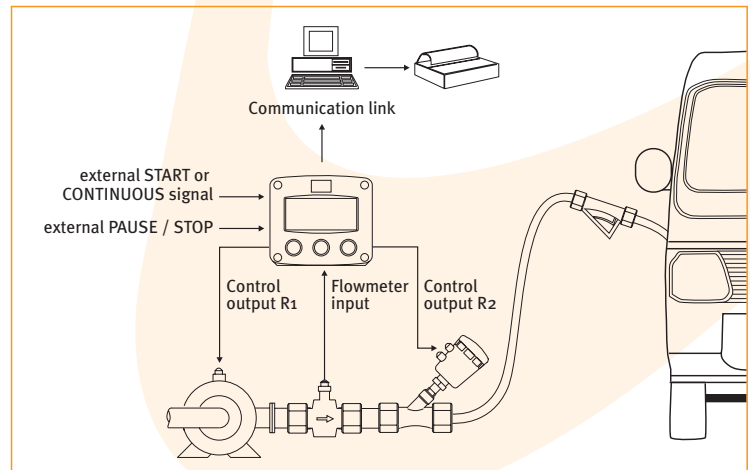

This model has been ATEX and IECEx certified Intrinsically Safe for gas and dust applications, with an allowed operational temperature of -40°C to +70°C (-40°F to +158°F).

A flame proof enclosure with ATEX certification offers the rating Ex II 2 GD EEx d IIB T5.

Enclosures

Various types of enclosures can be selected, all ATEX and IECEx approved. As standard the F133 is supplied in an GRP panel mount enclosure. Most popular is our rugged aluminum field mount enclosure with IP67 / NEMA 4X rating. Both European or U.S. cable gland entry threads are available.
