## General information

### Introduction

The F197 is a manual set-point generator. The operator enters an analog or a scaled output value or a percentage which will be transmitted as a (0)4 – 20mA or 0 – 10V DC signal to a control device. An analog input signal is possible but not necessary. There is no direct control relationship between the input and output value. A wide range of options further enhance this models capabilities, including Intrinsic Safety for hazardous area applications and full Modbus communication.

### Display

The display has large 17mm segments which can be set to show preset value, actual value and status simultaneously. On-screen engineering units are easily configured from a comprehensive menu.

### Configuration

All configuration settings are accessed via a simple operator menu which can be passcode protected. Each setting is clearly indicated with an alphanumerical description, which avoids confusing abbreviations and baffling codes. Once familiar with one F-series product, you will be able to program all models in the series without a manual. All settings are safely stored in EEPROM memory in the event of sudden power loss.

### Analog output signal

The analog output is transmitting any value, set by the operator. The output is scaled manually by the operator or through Modbus communication - the output can be scaled to any range (e.g. from 0% to 110%). The output signal is updated ten times per second. The output signal can be passive, active or isolated where the passive output type will loop power the F197 as well.

### Alarm output

two configurable outputs are available to transmit the alarm condition for low or high signal input alarms. The output signals can be a passive NPN, active PNP or an isolated electro-mechanical relay.

### Signal input

The F197 accepts analog input signals from flow, temperature, pressure or level input sensors. The input signal type can be selected by the user in the configuration menu without having to adjust any sensitive mechanical dip-switches or jumpers. Important: a sensor input signal is not required.

### Communication

All process data and settings can be read and modified manually or through the Modbus communication link (RS232 / RS485). Full Modbus functionality remains available for the Intrinsically Safe version (TTL).

### Hazardous areas

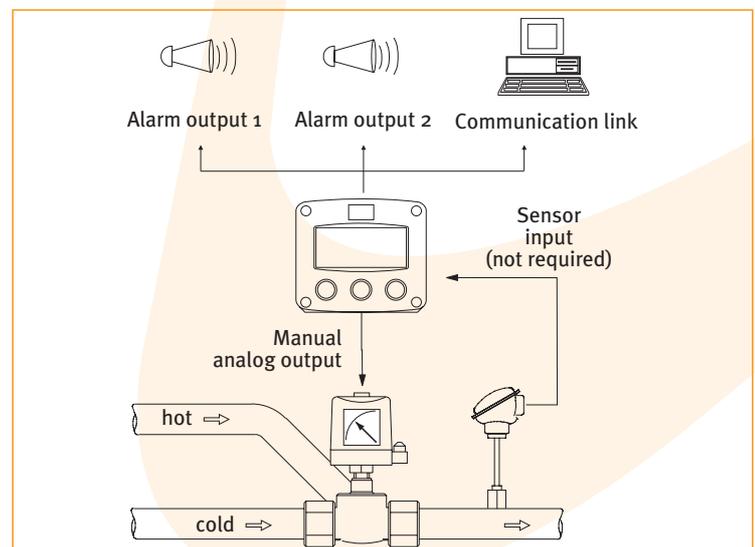

This model has been ATEX and IECEx certified Intrinsically Safe for gas and dust applications, with an allowed operational temperature of -40°C to +70°C (-40°F to +158°F).

A flame proof enclosure with ATEX certification offers the rating  $\text{Ex}$  II 2 GD EEx d IIB T5.

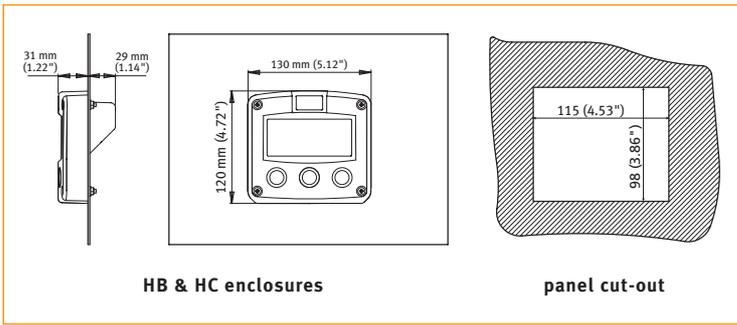

### Enclosures

Various types of enclosures can be selected, all ATEX and IECEx approved. As standard the F197 is supplied in an GRP panel mount enclosure, which can be converted to an IP67 / NEMA 4X GRP field mount enclosure by the addition of a back case. Most popular is our rugged aluminum field mount enclosure with IP67 / NEMA 4X rating. Both European or U.S. cable gland entry threads are available.

It is allowed to connect up to six barriers in IIB/IIIC applications or one barrier in IIC applications. Consult the certificate for the maximum input and output values of the circuits. Full functionality of the F197 remains available, including 8.2V sensor excitation for e.g. Namur sensors (type PD) and the Modbus communication type CT.
